**MODEL ANSWER KEY**

Exam Seat No.:

End-Sem Examination-I

Winter 2025

Academic Year: 2025-26

Sem: I

Class: FYMCA

Program: MCA

Branch Code:09

Pattern: 2024

Name of Course: Web Technologies

Course Code: 2409513

Max. Marks: 60

Duration: 2:30 Hrs.

**Instructions:** Candidates should read carefully the instructions printed on the Question Paper and on the cover page of the Answer Book, which is provided for their use.

*(keep space)*

1. This question paper contains 2 page(s).
2. Answer to each new question is to be started on a new page.
3. Assume suitable data wherever required, but justify it.
4. Draw the neat labelled diagrams, wherever necessary.
5. The last columns indicates the Course Outcome

<b>Q. No.</b>	<b>Details</b>	<b>Max. Marks</b>	<b>CO No.</b>	<b>BT Level</b>
<b>Q.1</b>	<p>a) Describe how HTML5 is used in modern web development and explain in what ways it improves the user experience compared to older versions of HTML. . ( 6 Marks)</p> <p>Answer:</p> <p>Solution: HTML5 revolutionized web development by introducing a more robust and user-friendly approach to Structuring and presenting web content. Key enhancements include:</p> <ul style="list-style-type: none"><li>• <b>Semantic Elements:</b> Elements like &lt;header&gt;, &lt;footer&gt;, &lt;article&gt;, and &lt;section&gt; provide meaningful structure, improving SEO and accessibility.</li><li>• <b>Multimedia Support:</b> HTML5 supports embedding audio (&lt;audio&gt;) and video (&lt;video&gt;) directly without third-party plugins, offering a seamless user</li></ul>	[6]	CO1	L2

**MODEL ANSWER KEY**

	<p>experience.</p> <ul style="list-style-type: none"> <li>• <b>Graphics &amp; Animation:</b> The &lt;canvas&gt; element and integration with SVG enable dynamic graphics and animations directly in the browser.</li> <li>• <b>Form Enhancements:</b> New input types (e.g., email, date) and built-in validation reduce reliance on JavaScript and improve form usability.</li> <li>• <b>Local Storage:</b> HTML5's Web Storage APIs (localStorage, sessionStorage) allow web applications to store data on the client side, offering better performance and offline capabilities.</li> <li>• <b>Cross-Platform Compatibility:</b> Designed with mobile and responsive design in mind, HTML5 ensures consistent performance across devices.</li> </ul> <p>These features collectively enhance the interactivity, responsiveness, and functionality of modern web applications, setting the foundation for rich, user-centric experiences.</p>			
<b>Q.2</b>	<p>a) Write and apply a JavaScript function to determine whether a given number is even or odd, and demonstrate how the logic works with an example.</p> <p>( 6 Marks) Answer:</p> <p style="padding-left: 40px;">Solution: function checkEvenOdd(num) {</p> <p style="padding-left: 80px;">if (num % 2 === 0) {</p> <p style="padding-left: 120px;">return "Even";</p> <p style="padding-left: 80px;">} else {</p> <p style="padding-left: 120px;">return "Odd";</p> <p style="padding-left: 80px;">}</p> <p style="padding-left: 40px;">}</p> <p><b>Explanation:</b></p> <ul style="list-style-type: none"> <li>• The function checkEvenOdd accepts a number num.</li> <li>• It uses the modulo operator (%) to determine the remainder when dividing num by 2.</li> <li>• If num % 2 === 0, it means the number is divisible by</li> </ul>	[6]	CO2	L3

**MODEL ANSWER KEY**

	<p>2, so it's even. Otherwise, it's odd.</p> <ul style="list-style-type: none"> <li>The if...else control structure applies conditional logic to decide the result.</li> </ul>												
<b>Q.3</b>	<p>a) Use real-world scenarios to illustrate how XML and JSON can be applied, and explain how their advantages and disadvantages affect their usage in those situations. ( 8 Marks)</p> <p>Solution:</p> <table style="width: 100%; border: none;"> <thead> <tr> <th style="text-align: left; width: 20%;"><b>Feature</b></th> <th style="text-align: left; width: 40%;"><b>XML</b></th> <th style="text-align: left; width: 40%;"><b>JSON</b></th> </tr> </thead> <tbody> <tr> <td><b>Advantages</b></td> <td> <ul style="list-style-type: none"> <li>- Rich metadata with attributes</li> <li>- Schema validation with DTD/Schema</li> <li>- Suitable for complex document structures</li> </ul> </td> <td> <ul style="list-style-type: none"> <li>- Lightweight and easy to read</li> <li>- Faster parsing and smaller size</li> <li>- Natively compatible with JavaScript</li> <li>- Limited metadata support</li> </ul> </td> </tr> <tr> <td><b>Disadvantages</b></td> <td> <ul style="list-style-type: none"> <li>- Verbose syntax</li> <li>- Requires parsing overhead</li> <li>- Complex to handle in browsers</li> </ul> </td> <td> <ul style="list-style-type: none"> <li>- Lacks robust validation like DTD</li> <li>- Not as human-readable for non-technical users</li> </ul> </td> </tr> </tbody> </table> <p><b>Explanation:</b></p> <ul style="list-style-type: none"> <li>XML is ideal for complex document structures and data integrity checks (via DTD/Schema).</li> <li>JSON excels in lightweight data exchange, particularly for web APIs and dynamic applications.</li> <li>The choice depends on project needs: XML for robust data modeling, JSON for speed and simplicity.</li> </ul> <p style="text-align: center;"><b>OR</b></p> <p>b) Describe JSON documentation. Illustrate how JSON elements are documented with acceptable values, data types, and nesting rules. Provide an example of documentation for a JSON object. ( 8 Marks)</p>	<b>Feature</b>	<b>XML</b>	<b>JSON</b>	<b>Advantages</b>	<ul style="list-style-type: none"> <li>- Rich metadata with attributes</li> <li>- Schema validation with DTD/Schema</li> <li>- Suitable for complex document structures</li> </ul>	<ul style="list-style-type: none"> <li>- Lightweight and easy to read</li> <li>- Faster parsing and smaller size</li> <li>- Natively compatible with JavaScript</li> <li>- Limited metadata support</li> </ul>	<b>Disadvantages</b>	<ul style="list-style-type: none"> <li>- Verbose syntax</li> <li>- Requires parsing overhead</li> <li>- Complex to handle in browsers</li> </ul>	<ul style="list-style-type: none"> <li>- Lacks robust validation like DTD</li> <li>- Not as human-readable for non-technical users</li> </ul>	[16]	CO3	L3
<b>Feature</b>	<b>XML</b>	<b>JSON</b>											
<b>Advantages</b>	<ul style="list-style-type: none"> <li>- Rich metadata with attributes</li> <li>- Schema validation with DTD/Schema</li> <li>- Suitable for complex document structures</li> </ul>	<ul style="list-style-type: none"> <li>- Lightweight and easy to read</li> <li>- Faster parsing and smaller size</li> <li>- Natively compatible with JavaScript</li> <li>- Limited metadata support</li> </ul>											
<b>Disadvantages</b>	<ul style="list-style-type: none"> <li>- Verbose syntax</li> <li>- Requires parsing overhead</li> <li>- Complex to handle in browsers</li> </ul>	<ul style="list-style-type: none"> <li>- Lacks robust validation like DTD</li> <li>- Not as human-readable for non-technical users</li> </ul>											

**MODEL ANSWER KEY**

<p>Answer:</p> <ul style="list-style-type: none"> <li>Solution: <b>JSON documentation</b> explains the structure, elements, data types, and allowed values of a JSON object.</li> <li>It ensures that developers understand how to create or consume JSON data.</li> <li><b>Key documentation aspects:</b> <ul style="list-style-type: none"> <li>Element names and descriptions</li> <li>Data types (string, number, boolean, array, object)</li> <li>Acceptable values (e.g., enums, ranges)</li> <li>Nesting and hierarchy rules</li> </ul> </li> </ul> <p><b>Example Documentation:</b></p> <pre> json CopyEdit {   "Student": {     "Name": "string (Required) - Full name of the student",     "ID": "number (Required) - Unique student ID",     "Department": "string (Optional) - Academic department",     "Email": "string (Optional) - Email address"   } } </pre> <p><b>Explanation:</b></p> <ul style="list-style-type: none"> <li>This describes the Student object with each property's type and whether it's required or optional.</li> <li>Acceptable values and descriptions clarify how to use the JSON structure, ensuring data consistency.</li> </ul>			
<p>c) Develop a sample JSON file for a library system and demonstrate how it can be applied in practice. Then, explain how its structure and usage differ from an equivalent XML representation.</p> <p>Answer:</p> <p>Solution: json</p> <pre> CopyEdit { </pre>		CO3	L3

**MODEL ANSWER KEY**

	<p>a) How would you implement the control statements in PHP with a focus on if-else, switch, and for each, using suitable example. (8 marks)</p> <p>Answer: Solution:</p> <ul style="list-style-type: none"><li>• <b>if-else:</b></li></ul> <pre>php CopyEdit if(\$role == 'admin') {     echo "Access granted."; } else {     echo "Access denied."; }</pre> <ul style="list-style-type: none"><li>• <b>switch:</b></li></ul> <pre>php CopyEdit switch(\$role) {     case 'admin': echo "Admin Panel"; break;     case 'editor': echo "Editor Panel"; break;     default: echo "User Panel"; break; }</pre> <ul style="list-style-type: none"><li>• <b>foreach:</b></li></ul> <pre>php CopyEdit \$users = ["Alice" =&gt; "admin", "Bob" =&gt; "editor"]; foreach(\$users as \$name =&gt; \$role) {     echo "\$name is \$role&lt;br&gt;"; }</pre> <ul style="list-style-type: none"><li>• <b>Application:</b> Control statements manage flow in user-based systems, ensuring the right content and permissions are displayed.</li></ul> <p style="text-align: center;"><b>OR</b></p> <p>b) Write and apply a PHP script that inserts form data (name and email) into a MySQL database, and demonstrate how the</p>			
<b>Q.4</b>		[16]	CO4	L3

MODEL ANSWER KEY

<p>flow of execution and error handling work in this process. (8 marks)</p> <p>Solution:</p> <pre>php CopyEdit \$conn = new mysqli("localhost", "root", "", "mydb"); \$name = \$_POST['name']; \$email = \$_POST['email']; \$sql = "INSERT INTO users (name, email) VALUES ('\$name', '\$email')"; if(\$conn-&gt;query(\$sql)) {     echo "User added."; } else {     echo "Error: ".\$conn-&gt;error; } \$conn-&gt;close();</pre> <ul style="list-style-type: none"><li>• <b>Flow:</b><ul style="list-style-type: none"><li>○ Form data (\$_POST) captured.</li><li>○ SQL INSERT query formed.</li><li>○ Checks for errors and outputs messages.</li><li>○ Closes connection.</li></ul></li></ul>			
<p>c) How to create and use a PHP array concept which helps to store student scores and calculate the average using a loop. (8marks)</p> <p>Solution:</p> <pre>php CopyEdit \$scores = [85, 90, 78, 92]; \$total = 0; foreach(\$scores as \$score) {     \$total += \$score; } \$average = \$total / count(\$scores); echo "Average score: \$average";</pre> <ul style="list-style-type: none"><li>• <b>Explanation:</b> Loops through array elements, sums scores, calculates average. Useful in student portals.</li></ul> <p style="text-align: center;"><b>OR</b></p>		CO4	L3

-----  
**MODEL ANSWER KEY**

d) Design a sample MySQL database schema for a small application, and then implement it in PHP by writing and executing SQL queries to insert, retrieve, and update data. Demonstrate the implementation with working PHP code and explain how each part of the code applies the schema and performs the database operations. (8marks)

Solution:

Let's create a simple employees table to store employee details:

Column	Data Type	Description
id	INT (Primary Key)	Auto-incremented ID
name	VARCHAR(100)	Employee's full name
email	VARCHAR(100)	Employee's email
department	VARCHAR(50)	Department name
salary	DECIMAL(10,2)	Employee salary

---

**Step 2: Create the Database and Table in MySQL**

sql

CopyEdit

```
CREATE DATABASE company;
```

```
USE company;
```

```
CREATE TABLE employees (  
  id INT AUTO_INCREMENT PRIMARY KEY,  
  name VARCHAR(100) NOT NULL,  
  email VARCHAR(100) NOT NULL,  
  department VARCHAR(50) NOT NULL,  
  salary DECIMAL(10,2) NOT NULL  
);
```

---

**Step 3: PHP Script to Connect to MySQL**

php

CopyEdit

```
<?php
```

```
// Database connection parameters
```

```
$servername = "localhost";
```

-----  
**MODEL ANSWER KEY**

<pre>\$username = "root"; \$password = ""; \$dbname = "company";  // Create connection \$conn = new mysqli(\$servername, \$username, \$password, \$dbname);  // Check connection if (\$conn-&gt;connect_error) {     die("Connection failed: " . \$conn-&gt;connect_error); } ?&gt;</pre> <hr/> <p><b>Step 4: Insert Data into the employees Table</b></p> <pre>php CopyEdit &lt;?php // Assuming connection \$conn is established (see Step 3)  // Insert employee data \$name = "John Doe"; \$email = "john.doe@example.com"; \$department = "Sales"; \$salary = 55000.00;  \$sql = "INSERT INTO employees (name, email, department, salary) VALUES (?, ?, ?, ?)"; \$stmt = \$conn-&gt;prepare(\$sql); \$stmt-&gt;bind_param("sssd", \$name, \$email, \$department, \$salary);  if (\$stmt-&gt;execute()) {     echo "New employee inserted successfully."; } else {     echo "Error inserting employee: " . \$stmt-&gt;error; }  \$stmt-&gt;close(); ?&gt;</pre> <hr/> <p><b>Step 5: Retrieve Data from the employees Table</b></p> <pre>php CopyEdit &lt;?php // Fetch all employees \$sql = "SELECT id, name, email, department, salary FROM employees";</pre>			
---	--	--	--

-----  
**MODEL ANSWER KEY**

```
$result = $conn->query($sql);

if ($result->num_rows > 0) {
    // Output data of each row
    while($row = $result->fetch_assoc()) {
        echo "ID: " . $row["id"] . " - Name: " . $row["name"] .
            " - Email: " . $row["email"] . " - Department: " .
            $row["department"] .
            " - Salary: $" . $row["salary"] . "<br>";
    }
} else {
    echo "No employees found.";
}
?>
```

---

**Step 6: Update Data in the employees Table**

```
php
CopyEdit
<?php
// Update salary of an employee by ID
$employee_id = 1; // For example, update employee with id =
1
$new_salary = 60000.00;

$sql = "UPDATE employees SET salary = ? WHERE id = ?";
$stmt = $conn->prepare($sql);
$stmt->bind_param("di", $new_salary, $employee_id);

if ($stmt->execute()) {
    echo "Employee salary updated successfully.";
} else {
    echo "Error updating salary: " . $stmt->error;
}

$stmt->close();
$conn->close();
?>
```

---

**Summary:**

- Step 1 & 2: Create database and table schema.
- Step 3: Connect PHP to MySQL.
- Step 4: Insert data using prepared statements for security.
- Step 5: Retrieve and display data.
- Step 6: Update existing data securely.

-----  
**MODEL ANSWER KEY**

<b>Q.5</b>	<p>a) Explain how ASP processes a client request. Illustrate the role of core ASP objects in managing user input. Provide an example of a simple ASP form processing. (8 marks)</p> <p>Answer: Solution:</p> <p>ASP (Active Server Pages) processes client requests on the server side. When a client sends a request (usually via HTTP), the IIS server hands it over to the ASP engine which parses the ASP script embedded in the webpage. The ASP engine executes the script, interacts with server resources (databases, files), and generates HTML output sent back to the client browser.</p> <p><b>Core ASP Objects:</b></p> <ul style="list-style-type: none"> <li>• <b>Request:</b> Collects data sent by the client (form data, query strings).</li> <li>• <b>Response:</b> Sends output to the client browser.</li> <li>• <b>Server:</b> Provides utility methods, such as URL encoding, script mapping.</li> <li>• <b>Session:</b> Stores user-specific information between requests.</li> <li>• <b>Application:</b> Shares data among all users.</li> </ul> <p><b>Example:</b></p> <pre>asp CopyEdit &lt;form method="post" action="process.asp"&gt;   Name: &lt;input type="text" name="username" /&gt;   &lt;input type="submit" value="Submit" /&gt; &lt;/form&gt;</pre> <p>In process.asp:</p> <pre>asp CopyEdit &lt;% Dim userName userName = Request.Form("username") Response.Write("Hello, " &amp;</pre>	[16]	CO5	L3

**MODEL ANSWER KEY**

<p>Server.HTMLEncode(userName)) %&gt;</p> <p><b>Explanation:</b> The form submits data via POST. ASP uses Request.Form to access the user input and safely outputs it using Server.HTMLEncode to avoid script injection.</p> <p style="text-align: center;"><b>OR</b></p> <p>b) Describe the stages of the JSP lifecycle and apply your understanding by explaining how these stages help in designing efficient JSP pages with an example. (8 marks)</p> <p>Answer:</p> <p>Solution: The JSP lifecycle consists of several stages:</p> <ol style="list-style-type: none"> <li>1. <b>Translation:</b> The JSP file is translated into a Java servlet. This happens only once unless the JSP is modified.</li> <li>2. <b>Compilation:</b> The generated servlet is compiled into bytecode.</li> <li>3. <b>Loading:</b> The servlet class is loaded into the JVM.</li> <li>4. <b>Instantiation:</b> The servlet instance is created.</li> <li>5. <b>Initialization (jspInit):</b> Servlet initialization method is called once.</li> <li>6. <b>Request Handling (_jspService):</b> Handles each client request. This is where the main JSP code runs.</li> <li>7. <b>Destruction (jspDestroy):</b> Called once before servlet is unloaded.</li> </ol> <p><b>Application:</b> Understanding these stages helps optimize JSP pages by:</p> <ul style="list-style-type: none"> <li>• Placing expensive initialization code in jspInit (runs once).</li> <li>• Minimizing code in the request handling part to improve response time.</li> <li>• Managing resources effectively using jspDestroy.</li> <li>• Avoiding frequent reloads by proper caching and compilation strategies.</li> </ul>				
<p>c) Apply your understanding of the .NET Framework by identifying the features that support rapid web application development in ASP.NET Web Forms and MVC, and demonstrate how the page lifecycle differs when these two</p>				CO5 L3
